

LOPROL

MRB Loprol™ (Low Protein NR Latex) was developed to offer NR latex materials of low protein content, specifically to address the protein allergy issue in NR latex products. Compared with other commercially available low protein latex it was found that MRB non-enzymatic Loprols was found to be the best Loprol™ in terms of extractable and allergenic protein contents. The Loprol™ is now produced using a more environmentally friendly approach.

The properties of the Loprol™ uncompounded latex is well suited for use in latex product manufacturing. In general, the protein content and nitrogen are comparable to commercial low protein lattices as commonly produced.
